CHAPTER 2

Background

This chapter gives necessary background.

1. Group theory

A group is a set G with a binary operation satisfying closure, associativity, identity, and inverses.

THEOREM 2.1. *Every finite subgroup of the multiplicative group of a field is cyclic.*

PROOF. This is a standard result from algebra. $\square$

CHAPTER 3

Main Result

Let Γ the fundamental group of a closed hyperbolic surface. Let $\rho, \rho' : \pi_1\Sigma \to SL_3\mathbb{C}$ Anosov. We use $\xi, \xi' : \partial\Gamma \to \mathcal{F}^3$ to mean the continuous, transverse, ρ- or ρ'- equivariant, dynamics-preserving boundary maps. We use $\Lambda, \Lambda' \subset \mathcal{F}^3$ to mean the limit curves, which are the images of ξ, ξ', respectively. We use $Th(\Lambda)$ to refer to the thickened limit curve. We use $Th(x)$ to refer to the thickening of a particular flag $x \in \Lambda$.

We call ρ, ρ' *topologically conjugate* if there exists a homeomorphism $F : \mathcal{F}^3 \to \mathcal{F}^3$ such that for all $g \in \Gamma$ and all $x \in \mathcal{F}^3$, then $F(\rho(g) \cdot x) = \rho'(g) \cdot F(x)$.

THEOREM 3.1. *Hyperconvexity is closed under topological conjugacy. In other words, if ρ and ρ' are topologically conjugate, then ρ is hyperconvex if and only if ρ' is hyperconvex.*

We assume $F : \mathcal{F}^3 \to \mathcal{F}^3$ is a topological conjugacy between ρ and ρ'. Clearly $F(\Lambda) = \Lambda'$. This mapping is pointwise, i.e. for all $\alpha \in \partial\Gamma$, then $F(\xi(\alpha)) = \xi'(\alpha)$. So for $x \in \Lambda$, we can use the notation $x' := F(x) \in \Lambda'$.

For any pair of transverse flags $x, y \in \mathcal{F}^3$, consider the irreducible 0-dim Richardson varieties $R^0_{x,y} := \{x, x_y, x^y, y_x, y^x, y\}$. If x and y are the attracting and repelling flags of $diag(2, 1, 0.5)$ then $R^0(x, y)$ consists of:

- $x = \{x\} \cap \alpha_{121}(y) = (e_1, e_1 + e_2)$
- $x_y = \alpha_1(x) \cap \alpha_{12}(y) = (e_1, e_1 + e_3)$
- $x^y = \alpha_2(x) \cap \alpha_{21}(y) = (e_2, e_1 + e_2)$
- $y_x = \alpha_{12}(x) \cap \alpha_1(y) = (e_3, e_1 + e_3)$
- $y^x = \alpha_{21}(x) \cap \alpha_2(y) = (e_2, e_2 + e_3)$
- $y = \alpha_{121}(x) \cap \{y\} = (e_3, e_2 + e_3)$.

LEMMA 3.1.1. *As a set, $F(R^0_{x,y}) = R^0_{x',y'}$.*

However, F may not pointwise preserve the "type" of Richardson variety. For all $x, y \in Lambda^{(2)}$,

- *if F* matches *Richardson varieties, then $F(x_y) = x'_{y'}$, $F(x^y) = x'^{y'}$, $F(y_x) = y'_{x'}$, and $F(y^x) = y'^{x'}$.*
- *if F* switches *Richardson varieties, then $F(x_y) = x'^{y'}$, $F(x^y) = x'_{y'}$, $F(y_x) = y'^{x'}$, and $F(y^x) = y'_{x'}$.*

As a consequence of the argument in Lemma 3.1.1, we also have $F(Th(x)) = Th(x')$ for all $x \in \Lambda$.

LEMMA 3.1.2. *The representation ρ is hyperconvex if and only if for all $x, y, z \in \Lambda^{(3)}$, then $R^0_{x,y} \cap R^0_{x,z} = \{x\}$.*

PROOF. (Theorem 3.1) Suppose $F : \mathcal{F}^3 \to \mathcal{F}^3$ is a topological conjugacy between ρ and ρ'.

We begin with the forward direction. Assume that ρ is hyperconvex. Let $x, y, z \in \Lambda^{(3)}$. By Lemma 3.1.2, then $x_y \neq x_z$ and $x^y \neq x^z$. By Lemma **??**, then $\{F(x_y), F(x^y), F(x_z), F(x^z)\} = \{x'_{y'}, x'^{y'}, x'_{z'}, x'^{z'}\}$ are distinct. Since x, y, z were general, then this holds for all triples in Λ and ρ' is hyperconvex.

The other direction proceeds similarly. Assume that ρ is *not* hyperconvex. By Lemma 3.1.2, there exist $x, y, z \in \Lambda^{(3)}$ such that $x_y = x_z$ or $x^y = x^z$. By Lemma 3.1.1, then F either matches or switches Richardson varieties. So one of the following is true: $x'_{y'} = x'_{z'}$ or $x'^{y'} = x'^{z'}$. Therefore ρ' is *not* hyperconvex. $\square$

Proof. (Lemma 3.1.1) Let's describe the dynamics of $\rho(g) \cdot \mathcal{F}^3$, where $g \in \Gamma$ infinite order. Since ρ is Anosov, then we know $\rho(g)$ is strongly loxodromic, i.e. its eigenvalues have distinct magnitude. That means it has an attracting and repelling fixed boundary points $g^+, g^- \in \partial\Gamma$. Let $x = \xi(g^+), y = \xi(g^-)$.

We define the "uphill" $U_g(x) := \{f : \rho(g^n) \cdot f \to x\}$ and "downhill" $D_g(y) := \{f : \rho(g^{-n}) \cdot f \to y\}$. Most flags are in the open and dense set $U_g(x) \cap D_g(y) \subset \mathcal{F}^3$. However, there is an exceptional locus $E_g = \mathcal{F}^3 \setminus (U_g(x) \cap D_g(y))$, i.e. the attracting or repelling flags for E_g are other fixed points under $\rho(g)$. The fixed points of $\rho(g) \cdot \mathcal{F}^3$ are exactly $R^0_{x,y}$.

These happen to be the irreducible 1-dim Richardson varieties of x, y:

- $\alpha_1(x) = \alpha_1(x) \cap \alpha_{121}(y) = \overline{U(x) \cap D(x_y)}$
- $\alpha_2(x) = \alpha_2(x) \cap \alpha_{121}(y) = \overline{U(x) \cap D(x^y)}$
- $span(x_y, y_x) = \alpha_{12}(x) \cap \alpha_{12}(y) = \overline{U(x_y) \cap D(y_x)}$
- $span(x^y, y^x) = \alpha_{21}(x) \cap \alpha_{21}(y) = \overline{U(x^y) \cap D(y^x)}$
- $\alpha_1(y) = \alpha_{121}(x) \cap \alpha_1(y) = \overline{U(y_x) \cap D(y)}$
- $\alpha_2(y) = \alpha_{121}(x) \cap \alpha_2(y) = \overline{U(y^x) \cap D(y)}$

Claim: $F(Th(x)) = Th(x')$
Claim: $F(R^0_{x,y}) = R^0_{x',y'}$.
Claim: $F(R)$
Claim: $F(R^0_{\rho(h)\cdot x, \rho(h)\cdot y}) = R^0_{\rho'(h)\cdot x', \rho'(h)\cdot y'}$.
Claim: Pairs of the form (g^+, g^-) are dense in $\partial\Gamma^2$

□

Proof. (Lemma 3.1.2) Suppose ρ is Anosov. Let $x = (x_1, x_2), y = (y_1, y_2), z = (z_1, z_2) \in \Lambda^{(3)}$. Since x, y, z are pairwise transverse, then clearly $y_x, y^x, z_x, z^x \notin R^0_{x,y} \cap R^0_{x,z}$. It suffices to check the pairs $x_y, x_z \in \alpha_1(x)$ and $x^y, x^z \in \alpha_2(x)$.

By definition, $x_y = (x_1, x_1 + y_1)$ and $x_z = (x_1, x_1 + z_1)$, which are distinct if and only if $x_1 + y_1 \neq x_1 | z_1$, or equivalently $z_1 \not\subset x_1 + y_1$.

Similarly, $x^y = (x_2 \cap y_2, x_2)$ and $x^z = (x_2 \cap z_2, x_2)$, which are distinct if and only if $x_2 \cap y_2 \neq x_2 \cap z_2$, or equivalently $x_2 \cap y_2 \not\subset z_2$.

So clearly $R^0_{x,y} \cap R^0_{x,z} = \{x\}$ for all $x, y, z \in \Lambda^{(3)}$ is equivalent to ρ hyperconvex. □

CHAPTER 4

Another result
